### **Today's Progress Report**

Today, we mainly worked on improving our existing prototype. Earlier, some features in our system were not working properly. Specifically, the Save Progress, Export PDF, and Start Countdown Timer options were only visible in the interface but were not functioning correctly in the backend.

So today, we made changes in the code to fix these issues. We connected the backend logic properly so that:

- Save Progress now actually stores the student's study progress.
- Export PDF now generates and downloads the timetable as a PDF for offline use.
- Start Countdown Timer now works correctly and helps students track study time and breaks.

After fixing these problems, we tested the prototype again to make sure these features are working smoothly.

Along with technical work, we also spent time preparing for our presentation. We discussed how to explain the project flow, features, and overall working clearly, especially the AI study suggestions and rescheduling concept.

Overall, today's work was focused on bug fixing, feature implementation, testing, and presentation preparation.
